

# COAXIAL RESONATORS

Thanks to its high know-how in ceramic material manufacturing, **EXXELIA TEMEX** has developed its own coaxial resonator product line. These products are the poles of filter, oscillator and duplexer functions for Telecom, Military & Space, Industrial and Wireless applications.

Coaxial resonators are designed to use the size-reducing effect of high dielectric constant materials in microwave functions such as VCOs (Voltage Controlled Oscillators), CROs (Coaxial Resonator Oscillators) and filters. Their use allows designers to get more compact devices.

## I. Basic Properties

### Resonance effect origins

The most commonly used mode in many applications is the TEM (Transverse Electro-Magnetic) mode. Such mode has neither electric nor magnetic field in the direction of propagation. They are contained primarily within the metallized ceramic.

Let's consider a line in which a signal is sent through "IN" and received in "OUT". When a coaxial resonator is connected, this one allows or blocks (whether it is  $\lambda/2$  or  $\lambda/4$  configurations) microwave energy corresponding to its resonant frequency (see Figure 1).

# COAXIAL RESONATORS

## Resonant frequency: f

The frequency is governed by the length of the coaxial resonator. This length is usually close to a quarter or half wavelength of the required frequency. Resonators are then defined as either quarter or half wavelength type.

Quarter wavelength resonators have only one end metallized to "short-circuit" the center conductor to the outer conductor, whereas both ends are non-metallized on half wavelength types. Frequency is given by:

- 1/2 applications :

$$f = \frac{300}{2L\sqrt{\epsilon_r}}$$

- 1/4 applications :

$$f = \frac{300}{4L\sqrt{\epsilon_r}}$$

where f is the resonant frequency (GHz), L the resonator length (mm) and  $\epsilon_r$  the dielectric constant.

Useful simplified formulas are given in below table to determine the resonator length.

	1/4 application	1/2 application
$\epsilon_r = 21$	$L = \frac{16.37}{f}$	$L = \frac{32.73}{f}$
$\epsilon_r = 38.5$	$L = \frac{12.09}{f}$	$L = \frac{24.17}{f}$
$\epsilon_r = 90$	$L = \frac{7.91}{f}$	$L = \frac{15.81}{f}$

## Impedance: $Z_0$

The coaxial resonator impedance is directly linked to the section, the inner hole diameter and the dielectric constant of the material. An equivalent circuit is given by a common RLC circuit.

# COAXIAL RESONATORS

For a  $\lambda/4$  coaxial resonator, having a nominal frequency  $f$  (MHz), a section  $S$  (mm), an inner hole diameter  $d$  (mm) and a dielectric constant  $\epsilon_r$ , the lumped elements are given by:

$$L = \frac{2Z_0}{\pi^2 f} \quad C = \frac{1}{8Z_0 f} \quad R = \frac{4Z_0 Q}{\pi}$$

with

$$\left\{ \begin{array}{l} Z_0 = \frac{60}{\sqrt{\epsilon_r}} \cdot \ln\left(1.079 \cdot \frac{S}{d}\right) \\ Q = 60 \cdot \frac{S\sqrt{f}}{25.4} \end{array} \right.$$

## Quality factor: Q

What is essentially required by designers is the lowest bandwidth at 3dB giving a more selective frequency. This performance is directly given by the Q factor which is essentially determined by the metallization. A thick film silver coating is then realized for excellent Q. Let's note that a low loss dielectric material does not influence at the first order the Q factor.

$$Q = 60 \cdot \frac{S\sqrt{f}}{25,4}$$

## II. User Guide

### How to order "Commercial Models"

## Materials and applications

Our portfolio is designed to offer the highest degree of freedom to electronic engineers. Several dielectric constants are available (21/38.5/90) allowing the best trade-off between impedance, Q factor and resonant frequency.

Operating temperature range: -40°C / +85°C

## Frequency range and general characteristics
