

# SNAPSIC

10 000 h / 85°C

16 V ... 500 V	22 µF ... 47 000 µF	Ø 22 (0,866) ... Ø 35 (1,378)	- 55°C + 85°C	Long Life Time
----------------	---------------------	-------------------------------	---------------	----------------

## APPLICATIONS

- For solid PC board mounting
- Switch mode power supplies
- Impulse current

Fixing: Printed SNAP-IN pins

Tolerance on capacitance at 20°C : ± 20 %  
 Operating temperature : - 55°C + 85°C

Ø PC board holes: 2 ± 0,1 (0,079 ± 0,004)

Dimensions in mm (inches)

Standard pins can be replaced by 4,5 (0,177) max pins on request

\* Out of range

## RESISTANCE TO VIBRATIONS

	Standard
f (Hz)	10 - 500 Hz
Amplitude	0,75 (0,030)
Acceleration	10 g - 98 m/s <sup>2</sup>
t (h)	3 x 10 sweep cycles

## SPECIFICATIONS

CECC 30301-811 Issue 1  
 DIN 41 240 - Climatic category GPF - 55°C + 85°C / 56 days  
 IEC 60 384.4 long life

## WITHSTAND STRENGTH OF INSULATING SLEEVE

Insulation resistance at 20°C between pins and mounting hardware: 100 MΩ.

Test voltage at 50 Hz 1 min between terminals and mounting hardware

Fire resistance: self extinguish 15 s (IEC 60 695-2-2).

10 000 h / 85°C

# General technical data

## 1. BASIC CONSTRUCTION

Structure of an electrolytic aluminum capacitor is shown hereunder:

1. Anode: aluminum foil
2. Dielectric: aluminum oxide
3. Papers spacers impregnated with electrolyte
4. Ionic conduction assumed by electrolyte
5. Cathode: aluminum foil

The positive plate is an etched aluminum foil covered with alumina which is the dielectric of the capacitor.

The negative plate is constituted by a second aluminum foil which serves as a current supply, and by electrolyte-impregnated papers layers.

The metal used for anode is a  $\geq 99,98\%$  grade aluminum.

The dielectric has a thickness of  $13 \text{ \AA} / V$ .

The aluminum used for the cathode is a  $\geq 98\%$  grade aluminum covered with a dielectric layer with a thickness of about  $40 \text{ \AA}$ .

## 2. DIAGRAM OF THE EQUIVALENT CIRCUIT

- $C_A$  = Capacitance of the anode
- $C_K$  = Capacitance of the cathode
- $R_p$  = Parallel resistance due to the aluminum oxide film.
- $R_L$  = Series resistance of connections, plates and impregnated spacer.
- $L_s$  = Inductance of winding and connections.

A standard simplified diagram is.

$C_s$  is the series capacitance of both anode and cathode capacitances. Electrolytic aluminum capacitors are naturally polarized because of the insulating film on the anode. Given the very thin aluminum oxide layer, a reversed voltage should not exceed 1.5 V when there is energy supply.

Short duration reverse voltages can be absorbed by special construction, second anode replacing the former cathode.

## 3. CAPACITORS MARKING

### 3.1. ARTICLE CODE (ON EACH PACKAGING)

A followed by 6 figures number. First 3 positions are specific of the range. (Ex. A 745xxx for a FELSIC 85 BD)

In FELSIC ranges, article code without first letter A, is printed on each capacitor.

a Figure 9 in fourth position shows a special product.

### 3.2. BATCH (ON EACH CAPACITOR).

3 figures or 6 figures

### 3.3. DATE (ON EACH CAPACITOR IF APPLICABLE)

4 figures (year-week)

## 4. ELECTRICAL CHARACTERISTICS

### 4.1. RATED CAPACITANCE $C_R$

The rated capacitance is defined at 100 Hz and at ambient temperature.

### 4.2. RATED VOLTAGE $U_R$

$U_R$  is the maximum DC voltage which may be applied in continuous operation.

When applying a superimposed alternating voltage, the peak value of the resulting waveform should not exceed the rated voltage.

### 4.3. PEAK VOLTAGE $U_p$

$U_p$  is the maximum repetitive voltage which can be applied within short periods.

Defined in CECC 30 300 and IEC 60 384-4:

1000 cycles of 30 s charge followed by a no load period of 5 min. 30 s with upper category temperature.

$$U_p \leq 1,15 U_R (U_R \leq 315 V)$$

$$U_p \leq 1,10 U_R (U_R > 315 V)$$

# General technical data

## 4.4. DISSIPATION FACTOR TANδ

The dissipation or loss factor is defined by its tangent  $\text{Tan}\delta$

$$\text{Tg}\delta = R_s C_s \omega$$

$$(\omega = 2\pi F)$$

**ESR** Capacitor Equivalent Series Resistance

**Cs** Capacitor capacitance

**F** Frequency [100 Hz]

**Z** Capacitor impedance

## 4.5. EQUIVALENT SERIES RESISTANCE ESR

The relation between ESR and dissipation factor  $\text{Tan}\delta$  is given in § 4.4.

## 4.6. IMPEDANCE Z - INDUCTANCE L

The impedance is given by:

$$Z = \sqrt{R^2 + \left[L\omega - \frac{1}{C\omega}\right]^2}$$

L inductance. Generally  $L = 5$  to  $20$  nH

Z and ESR as function of frequency typically follows the chart:

## 4.7. PERMISSIBLE RIPPLE CURRENT (I r.m.s.) I~

The current is defined at the maximum climatic category and at 100 Hz. It is the root mean square value r.m.s. The value  $I_0$  is the rated value for calculations of expected life up to  $3 I_0$ .

## 4.8. LEAKAGE CURRENT II

It is measured at  $20^\circ\text{C}$  after a 5 min. polarization under rated voltage.

For  $C_R$  in  $\mu\text{F}$  and  $U_R$  in V:

$I \leq 0,01 C_R U_R$  or  $1 \mu\text{A}^*$

when  $C_R U_R \leq 1000 \mu\text{C}$

$I \leq 0,006 C_R U_R + 4 \mu\text{A}$

when  $C_R U_R > 1000 \mu\text{C}$

For  $U_R > 350 \text{V}_{\text{DC}}$  it can be specified:

with  $K = 4, 6$  or  $8$

or

$I \leq 0,3 (C_R U_R)^{0,7} + 4 \mu\text{A}$  (CECC 30 300)

\* Whichever is the greater

## 4.9. CHARACTERISTICS

Versus temperature [typical values].

### 4.9.1. Capacitance drift

Versus temperature

### 4.9.2. ESR and Z drifts at 100 Hz

Versus temperature

### 4.9.3 Leakage current drift

# General technical data

## 5. SPECIFICATION TO APPLY

Electrolytic aluminum capacitors are defined in:

- NF and UTE French national standard
- CECC European specifications
- IEC international specifications

Quality insurance procedures are described in these specifications.

	French	European	International
Generic specification Fixed capacitors	NF C 83 100	CECC 30 000 EN 130 000	IEC 60 384 -1 QC 300 000
Sectional specification Electrolytic aluminum capacitors	NF C 83 110	CECC 30 300	IEC 60 384 - 4 C 300 300
Blank deta II specification - Electrolytic aluminum capacitors with non solid electrolyte.	UTE 83 110	CECC 30 301	IEC 60 384 - 4 -1 QC 300 301
Blank deta II specifications	CECC 30 301- 017 to CECC 30 301- 062 CO 31 to CO 55	CECC 30 301- 017 to CECC 30 301- 062 CECC 30 301- 802 to CECC 30 301- 811	

## 6. ENDURANCE TESTS / LIFE TIME

### 6.1. STANDARD ENDURANCE TEST

at max category temperature:

Temperature	Endurance test			
	Grade I - Long life			Grade II - General purpose
	10 000 h	5 000 h	2 000 h	1 000 h
125°C			•	
105°C		•	•	•
85°C	•	•	•	•

Standard endurance tests do not exceed 2000 hours at 125°C. However, present EXXELIA technologies concerning liquid electrolytes have led to endurance tests up to 5000 hours at 125°C (PRORELSIC 125 - FELSIC 125 RS) and even 20000 hours at 125°C (PRORELSIC 145 - ALSIC 145)

### 6.2. PERFORMANCE REQUIREMENTS ON STANDARD ENDURANCE TESTS.

Permissible capacitance drift  $\Delta C/C$  (%)

Permissible increase factors on  $\tan\delta$ , ESR, Z and II initial values

$U_R$	Endurance test			
	Grade I			Grade II
	10 000 h	5 000 h	2 000 h	1 000 h
6,3 V			+15 -30	+25 -40
10 V - 35 V	+15 -20	$\pm 15$	$\pm 15$	$\pm 30$
40 V - 160 V	$\pm 15$	$\pm 15$	$\pm 15$	$\pm 30$
> 160 V	$\pm 15$	$\pm 10$	$\pm 10$	$\pm 15$

	Endurance test			
	Grade I			Grade II
	10 000 h	5 000 h	2 000 h	1 000 h
$\tan\delta$ or ESR [1]	1,5	1,3	1,3	1,5
Z [2]	3	2	2	3
II	Standard values			

[1]  $\tan\delta$  or ESR: for initial value, take standard value.

[2] Z: for initial value, take specified value [see data sheet ].

Specific requirements can be taken into consideration with regards to initial values of dissipation factor or equivalent series resistance and impedance.

## 6.3. FAILURE CRITERIA FOR ELECTROLYTIC CAPACITORS.

Failure criteria are defined in CECC 30 301

- Non measurable defaults leading to complete failure.
- Measurable defaults leading to adjustment losses of the load circuit (failure due to variations).

### 6.3.1. Non measurable defaults.

They might be summed up as:

- Open circuit
- Short circuit
- Operation of pressure relief device
- Severely damaged insulation
- Unusable terminations

### 6.3.2. Measurable defaults.

Variations exceeding the values given below characterize a default.

- Capacitance drift  $\Delta C/C$  (%): 3 times the limit for standard endurance testing or 50 % (whichever is the smallest).
- $\tan\delta$  or ESR: 3 times standard max initial values.
- Z: 3 times standard max initial values.
- II: initial limit (under load conditions).

Specific requirements can be taken into consideration with regards to lower drifts.

## 6.4. INFLUENCE OF MAIN PARAMETER ON OPERATIONAL LIFE.

### 6.4.1. Temperature.

The capacitors operational life is highly dependent upon its internal temperature  $\Theta_i$  and therefore upon the ambient temperature and the ripple current.

Knowing ESR and dissipated power values (§ 6.4.3.) one can figure out, the internal temperature rise and then determine the capacitors expected life.

With present high boiling point electrolytes (§ 8.6)

$\Theta_i$  max = 125 to 185°C depending on styles.

### 6.4.2. Ripple current.

The ripple current flowing through the capacitor increase the internal temperature through power dissipation.

Standards define the permissible current at 100 Hz and generally consider a temperature rise of 5 to 10°C of max category temperature.

Current waveforms and frequencies make it difficult to clearly determine the capacitors internal temperature rise, which defines the operationally life.

Experiments confirm following relationship:

$$\Theta_i = \Theta_a + (\Theta_c - \Theta_a) K$$

Where:

- $\Theta_i$  = Internal hot spot temperature
- $\Theta_a$  = Ambient temperature
- $\Theta_c$  = Case temperature
- K = Parameter depending upon case diameter and cooling  
 $0 \geq 51 k = 2 \pm 0,5$   
 $0 < 51 k = 1,5 \pm 0,5$  (air cooling - 0,2 m/s)

# General technical data

## r.m.s. value according to current waveform.

Function	Mean value	R.m.s. value	Function	Mean value	R.m.s. value	Function	Mean value	R.m.s. value
	$A (t_0/T)$	$A \sqrt{t_0/T}$		$A/2$	$A \sqrt{3}$		$2A/\pi$	$A / \sqrt{2}$
	$A (t_1/T)$	$A \sqrt{2t_1/3T}$		$2A/\pi (t_0/T)$	$A \sqrt{t_0/2T}$		$A/2$	$A / \sqrt{3}$
	$A/2 (t_0/T)$	$A \sqrt{t_0/3T}$		$A/2 (t_0/T)$	$A \sqrt{t_0/3T}$		0	A

### 6.4.3. Dissipated power versus case dimension

For calculations of ripple currents, considering an internal temperature rise of 10°C

$P = ESR \cdot I^2$

P = Dissipated power (mW)

( $\Theta_i - \Theta_a = 10^\circ\text{C}$ )

ESR: Equivalent series resistance (100 Hz 20°C)

I: Ripple current (r.m.s. value at 100 Hz)

For different frequencies from 100 Hz, I must be multiplied by the factor F, according to above chart.:

### 6.4.4. Thermal resistance Rth and air cooling

Rth is static thermal resistance (without cooling) between capacitor central hot spot and ambient temperature measured at a distance of one capacitor diameter

Forced or not cooling air can lead to a significant decrease of these values.

Consequently, r.m.s. ripple current can be increased as a function of air cooling speed:

Ø mm (inches)	≤ 0,5 m/s	1 m/s	2 m/s	3 m/s	≥ 4 m/s
66 - 90	1~	1,1~	1,2~	1,25~	1,3~
36 - 51	1~	1,2~	1,4~	1,45~	1,5~

This parameter shall be applied to one capacitor alone.

For capacitors in bank, ambient temperature must be strictly equal around all capacitors.

### 6.4.5. Quality guaranty

We guarantee products manufactured during 2 years from the data of shipment against defaults of material and assembly.

This guaranty can be involved by the buyer only if our products are used within normal conditions, always according to the state of the art and taking in account storage conditions.

The equipment design should take into consideration possible failures of our capacitors and related effects in order to avoid them.

Guaranty is not applicable for damages occurred by surge voltage, irregular use, polarity inversion or maintenance default.

Guaranty is exclusively limited to the replacement of individual defective capacitors within the terms of delivery. This rule applied to all cases and particularly to any further consequence of failures.

### 6.4.6. Reliability

Failure rate:

$$FR = \frac{\text{Number of components tested} \times \text{test duration}}{\text{Number of failures}}$$

Failure rate is measured in FIT (failure in time =  $10^{-9}$  / hour).

The failure rate is set up during the life time of the capacitor (phase II)

I. Early failure phase (generally excluded during ageing process).

II. Operational life time of the capacitors

III. End of life

# General technical data

Mean time between failures MTBF = 1/FR mesured in years

## 7. MANUFACTURING FLOW CHART

Process controls

# General technical data

## 8. INFORMATION ON APPLICATION

### 8.1. CLEANING SOLVENTS

Use aliphatic alcohols, such as denatured ethyl alcohol, isopropanol, or butylacetate, or else alkaline diluted solutions. Avoid incompatible solvents (halogenous for example).

### 8.2. SHELF LIFE

There is no electrical characteristics variation for long periods of storage except leakage current which can increase.

It is caused by chemical reactions between the dielectric alumina and the electrolyte. These reactions are reversible when switched on. Capacitors can generally be stored at temperature between  $-5^{\circ}$  and  $+50^{\circ}\text{C}$  without reforming for the following periods of time:

- For  $U_R \leq 100\text{ V}$ , storage time: ..... 5 years (up to 10 years under specific conditions)
- For  $100\text{ V} < U_R \leq 360\text{ V}$  storage time: ..... 3 years
- For  $360\text{ V} < U_R < 500\text{ V}$  storage time: ..... 1 year
- For  $U_R \leq 500\text{ V}$ , storage time: ..... 6 months

Generally when these periods are overstepped, one hour at rated voltage causes the decrease of leakage current under the specified limits. An other way to avoid this leakage current increase problem is to always limit available power through capacitor during first seconds or minutes after storage or transport, according to the following chart:

### 8.3. LOW PRESSURE RESISTANCE

EXXELIA capacitors can be used with ambient low pressure decreasing up to 10 mbar (altitude 28000 m – 92000 feet).

### 8.4. MOUNTING SCREW TERMINALS CAPACITORS (FELSIC)

Capacitors may be used vertically (terminals on top) or horizontally. When used horizontally, the following position in relation to the safety vent, is recommended:

Mounting capacitors in series may be used for operating voltage exceeding  $U_R$ . See FELSIC in bank.

### 8.5. MOUNTING SOLDER TYPE CAPACITORS.

They may be used in any position. During mounting, avoid applying excessive force to capacitor pins or wires. There is a risk of damaging internal connections.

After soldering and for the same reasons, do not try to move the capacitor's body.

### 8.6. ELECTROLYTES: SAFETY RULES.

Electrolytes used in EXXELIA capacitors are manufactured by EXXELIA. Main solvents are generally  $\gamma$  butyrolactone and ethylene glycol, very stable high boiling point solvents. Ionic conductive salts in electrolyte induce a very weak acidity (pH 5 to 7).

### 8.7. ENVIRONMENT.

In aluminium capacitors with liquid electrolyte there is no component showing a pollution risk, in small amounts, of air or water. EXXELIA is always involved in this security field particularly in using chemicals for electrolyte, without well-known risks.

- Dimethylformamide (DMF) dangerous solvent forbidden in several uses is completely excluded by EXXELIA, since 1990.
- There is no halogen compound such as chlorofluorocarbon (CFC or FCKW in german) or polychlorobiphenyl (PCBPyralene) or pentabromodiphenylether or octabromodiphenylether.

There is neither benzene, toluene or phenyl compound nor explosive such as picric acid, nor asbestos in plastic covers. All the capacitors made by EXXELIA since 1991, can be scrapped or used in raw materials recycling processes without special care in compliance with Community rules.

EXXELIA aluminium capacitors with non-solid electrolyte are particularly suitable for different kinds of environment taking in account severity increasing laws.

European directives 2003/11/EC, 2002/96/EC (WEEE) and 2002/95/EC (RoHS) applies to all EXXELIA capacitors including every solder type, manufactured with pure tin coated pins or wires, since at least January 2006.
